

$$B(M_H^1) = 257$$

$$B(M_H^3) = 3$$

$$B(M_H^2) = 25$$

$$B(M_H^4) = 9$$

Ref's mind: $B = 23579$

$$\Phi = \{257, 9\}$$

$$B^\Phi = 3$$

$$I_G = B(M_H^2) - 25$$

R: 7?

O: no

R: query state $\leftarrow \begin{cases} K_I = \emptyset \\ K_{II} = 57 \end{cases}$

Hypothesis 2 (Structural Redundancy). Two answer-preserving reductions on $\mathbb{M}^H$ – (i) discarding human models M_k^H whose transition support strictly contains that of some other M_j^H , and (ii) propagating the dominance entailment $b_2 \notin I_G \Rightarrow b_1 \notin I_G$ whenever $\forall \phi \in \Phi, b_1 \in \phi \Rightarrow b_2 \in \phi$ – reduce the expected number of oracle queries relative to the baseline value-iteration policy on the query MDP, while leaving Φ and the final answer unchanged.

$$\forall \phi \in \Phi, 5 \in \phi \Rightarrow 7 \in \phi$$

$$\text{hence } 7 \notin I_G \Rightarrow 5 \notin I_G$$
